

Who needs a PFT?

The 60-second guide
for busy practices

Known or suspected COPD and asthma

Diagnosis. Staging.
Annual follow-up.

No spirometry, no COPD diagnosis.
Full stop.

Already in your **waiting room**

- Unexplained shortness of breath
- Chronic cough over 8 weeks
- Smokers and ex-smokers 40+
- Abnormal chest imaging
- Occupational exposures

Testing you may **not** have considered

- Pre-op clearance
- Autoimmune disease with possible lung involvement
- Long-COVID follow-up
- Baseline before lung-toxic medications

When spirometry alone can't answer it

- Suspected restriction
- Unexplained low FVC
- Any time you need DLCO

That calls for full PFTs:
lung volumes + diffusion.

Yes — it's reimbursable

Every test on this list has an established CPT code.

**The codes, in plain English:
next Tuesday**
